Gas
&
vapor

The Gaseous State

Particles have sufficient energy to overcome all forces of attraction

Particles completely separated from others

Results in low densities

Gases completely fill their containers

Observed Properties of Matter

Solids, liquids, & gases can be easily recognized by their different properties

States of Matter

SOLID

LIQUID

GAS

PLASMA

Solid

Holds Shape

Fixed Volume

Liquid

Shape of Container

Free Surface

Fixed Volume

Gas

Shape of Container

Volume of Container

Observed Properties of Matter

Property	State		
	Solid	Liquid	Gas
DENSITY	high	high	low
COMPRESSIBILITY	small	small	large
THERMAL EXPANSION	very small	small	moderate

The Gas Laws

The effect of T, P and V on gases has been extensively studied

The relationships between temperature, pressure, volume and moles are called the **gas laws**

Some definitions

Pressure

Gases exert pressure on their container

Pressure is defined as force per unit area
pressure = force/area

Pressure

Gases exert pressure on their container

Pressure is defined as force per unit area

$$\text{pressure} = \text{force/area}$$

Barometer

Device used to measure atmospheric pressure

Units of Pressure

1 atmosphere = 760 torr
760 mm Hg
29.9 in Hg
15 lb/in²

SI unit: **Pascal**  101,325 Pa

Units for Other Properties

Volume

Liters

Temperature

Kelvin

**no negative
temperatures**

Moles

**Amounts
in moles**

The Gas Laws

Laws that show the relationship between volume and other properties of gases

Boyle's law

Charles' law

Avodagro's law

Ideal Gas law combines all into 1 law

Boyle's law

**Increasing
pressure \circ
decreases
volume**

**shows how P
and V vary at
constant temp**

Boyle's Law

$$P \propto \frac{1}{V}$$

$$P = \frac{k}{V}$$

$$PV = k$$

$$P_1 V_1 = P_2 V_2$$

Charles' law

Increasing temperature ° increases volume

$$V \propto T$$

$$V = k T$$

$$\frac{V}{T} = k$$

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

Avogadro's law

Increasing moles \circ increases volume

V \propto moles(n)

$$V = k n$$

**In a chemical reaction:
mole ratio = volume ratio**

The Ideal Gas Law

A combination of Boyle's, Charles' and Avogadro's laws

$$V \propto 1/P \times T \times n$$

$$V = R \times 1/P \times T \times n$$

$$PV = nRT$$

R called gas law constant

The Ideal Gas Law

Units: **P = atm**
 V = liter
 T = K
 n = mol

R = 0.082 L.atm/mol.K

R = 8.31 L.kPa/mol.K when P = kPa

Example

What is the volume of 2.0 moles of gas, at 3.50 atm and 310 K?

$$PV = nRT$$

$$V = \frac{nRT}{P}$$

$$= \frac{2.0 \times 0.082 \times 310}{3.50} = 14.5 \text{ L}$$

Using the Ideal gas Law

$$PV = nRT$$

$$\frac{PV}{T} = nR$$

$$\frac{PV}{T} = \text{constant}$$

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

Using the Ideal gas Law

$$PV = nRT$$

$$\frac{m}{M} = n$$

$$PV = \frac{mRT}{M}$$

$$M = \frac{mRT}{PV}$$

Using the Ideal gas Law

$$PM = \frac{mRT}{V}$$

$$PV = \frac{mRT}{M}$$

$$D = \frac{m}{V}$$

$$PM = DRT$$

$$\frac{PM}{RT} = D$$

Dalton's Law of partial pressures

Total P = sum of individual pressures

$$P_{\text{air}} = P_{\text{N}} + P_{\text{O}} + P_{\text{water}} + P_{\text{He}}$$

Collect gases by water displacement

$$P_{\text{total}} = P_{\text{gas}} + P_{\text{water}}$$

Graham's Law of Effusion

Rate of gas movement $r \propto 1/M^{1/2}$

Smaller molecules move faster

H₂ moves 4× faster than O₂

$$r_a/r_b = (M_b/M_a)^{1/2}$$

Kinetic Theory of Matter

A model used to explain the behavior of matter

It postulates that.....

matter is composed of small particles

each particle is in constant motion.....**kinetic energy**

Particles contain **potential energy** due to the attractions and repulsions between them

Particles move faster as temperature increases

Particles transfer energy when they collide
